[Remote Programming Management Software](#)

DataPlace® Remote Programming Management Software allows the user to create placement programs and label layouts using a remotely located desktop computer. Placement programs and label formats from that computer can then be made available to the DataPlace machines that are connected to the user's network. One license and USB license key device are included.

[Master Library Management Software](#)

DataPlace® Library Management Software provides access to a centralized database of placement programs and label layouts located at a designated location on the users network. The Master Library Management Software requires all operator selected placement programs and label layouts to be compared and matched to the "Master" location. If the local program or layout differs from the "Master" the operator is notified and must choose either the local or the "Master" program and layout.

[Master Serial Number Management Software](#)

Installing the Master Library Software allows the customer to share a common Label Library amongst multiple networked DataPlace machines. The Master Serial Number Management Software runs as a separate application in conjunction with the Master Library Management Software (required). One machine acts as a "Master" and allocates serial numbers to the other networked machines ("slaves").

Note: Master Serial Number Management Software should not be installed in applications requiring manipulation or modification of the serial number on any "slave" machine.

Note: Master Serial Number Management Software should not be installed in applications requiring the use of customized sequential serial numbers.

[Automatic Data Back-up](#)

The DataPlace® Automatic Data Back-up utility delivers the capability to schedule automatic back-ups of the database and label layouts that reside on the hard-drive of a DataPlace labeling machine.

[Customer Specific Integration Software](#)

Customer Specific Integration Software allows standard DataPlace software and control systems to be modified to meet a user's unique needs. This custom software requires the prospective buyer to submit a written description or specification.
